Domain 3: Cloud Technology and Services

Task Statement 3.1: Define methods of deploying and operating in the AWS Cloud

Knowledge of:
• Different ways of provisioning and operating in the AWS Cloud
• Different ways to access AWS services
• Types of cloud deployment models
• Connectivity options

Skills in:
• Deciding between options such as programmatic access (for example, APIs, SDKs, CLI), the AWS Management Console, and infrastructure as code (IaC)
• Evaluating requirements to determine whether to use one-time operations or repeatable processes
• Identifying different deployment models (for example, cloud, hybrid, onpremises)
• Identifying connectivity options (for example, AWS VPN, AWS Direct Connect, public internet)

Great request 👍 — this is **exactly the level of understanding the exam expects**, especially for **scenario-based questions**.

Below is a **more detailed, exam-oriented explanation** of **Task 3.1**, with special focus on **latency, bandwidth, connectivity, and when to choose what**.
(All AWS services include **full forms**.)

🚀 Domain 3 – Cloud Technology & Services

Task 3.1: Methods of Deploying and Operating in the AWS Cloud (Detailed)

🛠️ PROVISIONING & OPERATING IN AWS (DETAILED)

🖥️ AWS Management Console

What it is:
A **browser-based graphical user interface (GUI)** to manage AWS resources.

How it works:

- You log in via web browser
- Perform actions using menus and forms
- Changes are manual and immediate

Best suited for:

- Learning AWS
- One-time configurations
- Small environments

Limitations:

- Error-prone for large environments
- Not ideal for repeatability
- No version control

📌 **Exam scenario:**
"Admin needs to quickly launch one EC2 instance" → **AWS Management Console**

⌨️ AWS Command Line Interface (CLI)

Full Form: AWS **Command Line Interface**

What it is:
A tool that lets you interact with AWS services using **commands**.

How it works:

- Installed on local machine or EC2

- Uses AWS APIs in the background
- Supports scripting and automation

Benefits:

- Faster than console
- Repeatable commands
- Can be integrated into scripts

Limitations:

- Requires command knowledge
- Still procedural (not declarative)

📌 **Exam scenario:**
"Automate repeated administrative tasks" → **AWS CLI**

💻 AWS Software Development Kits (SDKs)

Full Form: AWS **Software Development Kits**

What it is:
Libraries for programming languages (Python, Java, JavaScript, C#, etc.).

How it works:

- Developers write application code
- SDK makes API calls to AWS services

Best suited for:

- Application-level integration
- Event-driven workflows
- Backend automation

📌 **Exam scenario:**
"Application needs to upload files to Amazon S3 automatically" → **AWS SDK**

🧩 Infrastructure as Code (IaC) – AWS CloudFormation

Full Form: AWS **CloudFormation**

What it is:
A **declarative** way to define infrastructure using templates (YAML/JSON).

How it works:

- You define desired infrastructure state
- AWS provisions and manages resources automatically
- Supports rollback and version control

Key advantages:

- Repeatability
- Consistency
- Reduced human error

📌 **Exam scenario:**
"Deploy same infrastructure across multiple environments" → **AWS CloudFormation**

🔁 ONE-TIME VS REPEATABLE OPERATIONS (DEEPER VIEW)

One-Time Operations

- Manual setup
- No reuse expected
- Quick changes

Tools:

- AWS Management Console

Example:

- Testing a new EC2 instance type

Repeatable Processes

- Multiple environments
- Automation required
- Consistency needed

Tools:

- AWS CloudFormation
- AWS CLI scripts

📌 **Exam phrase:**
"Repeatable, consistent, automated" → **Infrastructure as Code**

☁️ CLOUD DEPLOYMENT MODELS (DETAILED)

☁️ Cloud Deployment

- Entire workload runs in AWS
- Highest elasticity and scalability
- Minimal infrastructure management

Benefits:

- No data center management
- Global reach
- High availability

📌 **Exam scenario:**
"Startup with no existing infrastructure" → **Cloud**

🏢 On-Premises Deployment

- Infrastructure hosted locally
- Uses virtualization
- High upfront cost

Drawbacks:

- Fixed capacity
- High maintenance cost

📌 **Exam scenario:**
"Strict regulatory requirements requiring local hardware" → **On-premises**

🔀 Hybrid Deployment

- Combines AWS + on-premises
- Gradual cloud migration
- Business continuity

Typical use cases:

- Disaster recovery
- Data residency requirements

📌 **Exam scenario:**
"Extend on-premises data center to cloud" → **Hybrid**

🌐 CONNECTIVITY OPTIONS (VERY IMPORTANT)

🌍 Public Internet

How it works:

- Uses standard HTTPS
- No dedicated connection

Performance:

- Variable latency
- Shared bandwidth

Latency:

- Higher and unpredictable
- Depends on internet traffic

Bandwidth:

- Limited by ISP
- Not guaranteed

📌 **Exam scenario:**
"Basic internet access to AWS services" → **Public Internet**

🔐 AWS VPN

Full Form: AWS **Virtual Private Network**

How it works:

- Encrypted tunnel over the public internet
- Uses IPSec

Performance:

- More secure than public internet
- Still internet-dependent

Latency:

- Lower than public internet
- Still variable

Bandwidth:

- Moderate
- Not dedicated

📌 **Exam scenario:**
"Secure connection without dedicated line" → **AWS VPN**

🚀 AWS Direct Connect

Full Form: AWS **Direct Connect**

How it works:

- Dedicated private network connection
- Bypasses public internet

Performance:

- Very low latency
- Consistent performance

Latency:

- Predictable
- Minimal delay

Bandwidth:

- High (1 Gbps to 100 Gbps)
- Dedicated and guaranteed

Cost:

- Higher
- Best for enterprise workloads

📌 **Exam scenario:**
"High bandwidth, low latency, mission-critical workloads" → **AWS Direct Connect**

📊 CONNECTIVITY COMPARISON (EXAM GOLD)

Feature	Public Internet	AWS VPN	AWS Direct Connect
Encryption	❌	✅	✅
Dedicated	❌	❌	✅
Latency	High	Medium	Low
Bandwidth	Low	Medium	High
Cost	Low	Medium	High

🧠 MEMORY RULES FOR EXAM

- **Latency = delay**
- **Bandwidth = data volume per second**
- **Dedicated line → Direct Connect**
- **Encrypted tunnel → VPN**
- **Free & simple → Public Internet**
- **Repeatable infra → CloudFormation**

🔥 EXAM-TRAP MCQs (Task 3.1)

Q1.

A solutions architect wants a **repeatable, consistent way** to deploy identical AWS resources across multiple environments. Which option should be used?

A. AWS Management Console
B. AWS Command Line Interface (CLI)
C. AWS CloudFormation
D. AWS Software Development Kit (SDK)

Q2.

Which method provides **programmatic access** to AWS services and is most suitable for embedding AWS calls inside application code?

A. AWS Management Console
B. AWS Software Development Kit (SDK)
C. AWS Direct Connect
D. AWS CloudFormation

Q3.

A company requires **low-latency, high-bandwidth, and predictable network performance** between its on-premises data center and AWS. Which connectivity option is BEST?

A. Public Internet
B. AWS Virtual Private Network (VPN)
C. AWS Direct Connect
D. Amazon CloudFront

Q4.

Which AWS connectivity option uses an **encrypted tunnel over the public internet**?

A. AWS Direct Connect
B. AWS Virtual Private Network (VPN)
C. Public Internet
D. Amazon VPC Peering

Q5.

An administrator wants to **quickly launch a single Amazon EC2 (Elastic Compute Cloud) instance** for testing purposes. Which access method is MOST appropriate?

A. AWS CloudFormation
B. AWS Software Development Kit (SDK)
C. AWS Management Console
D. AWS Command Line Interface (CLI)

Q6.

Which cloud deployment model combines **on-premises infrastructure with AWS Cloud resources**?

A. Cloud
B. Private Cloud
C. Hybrid
D. Multi-cloud

Q7.

A developer uses scripts to automate AWS resource creation from a terminal. Which access method is being used?

A. AWS Management Console
B. AWS CloudFormation
C. AWS Command Line Interface (CLI)
D. AWS Software Development Kit (SDK)

Q8.

Which statement BEST describes **AWS CloudFormation**?

A. A graphical interface for managing AWS
B. A tool for monitoring AWS billing
C. A service that defines infrastructure using code templates
D. A secure connectivity service

Q9.

Which connectivity option offers the **LOWEST latency** and **HIGHEST bandwidth**?

A. Public Internet
B. AWS Virtual Private Network (VPN)
C. AWS Direct Connect
D. AWS Management Console

Q10.

A startup with **no existing infrastructure** wants to deploy all workloads directly on AWS. Which deployment model should they use?

A. On-premises
B. Hybrid
C. Cloud
D. Private Cloud

✅ ANSWERS

1️⃣ **C** – AWS CloudFormation
2️⃣ **B** – AWS Software Development Kit (SDK)
3️⃣ **C** – AWS Direct Connect
4️⃣ **B** – AWS Virtual Private Network (VPN)
5️⃣ **C** – AWS Management Console
6️⃣ **C** – Hybrid
7️⃣ **C** – AWS Command Line Interface (CLI)
8️⃣ **C** – Infrastructure as Code using templates
9️⃣ **C** – AWS Direct Connect
🔟 **C** – Cloud

🧠 QUICK EXAM MEMORY CHECK

- **Repeatable infra** → CloudFormation
- **Application code access** → SDK
- **Terminal automation** → CLI

- **Low latency + high bandwidth** → Direct Connect
- **Encrypted internet tunnel** → VPN
- **Click-based setup** → Console

Task Statement 3.2: Define the AWS global infrastructure.

Knowledge of:
• AWS Regions, Availability Zones, and edge locations
• High availability
• Use of multiple Regions
• Benefits of edge locations
• AWS Wavelength Zones and AWS Local Zones
Skills in:
• Describing relationships among Regions, Availability Zones, and edge locations
• Describing how to achieve high availability by using multiple Availability Zones
• Recognizing that Availability Zones do not share single points of failure
• Describing when to use multiple Regions (for example, disaster recovery, business continuity, low latency for end users, data sovereignty)
• Describing at a high level the benefits of edge locations (for example, Amazon CloudFront, AWS Global Accelerator)

Excellent — **Task 3.2 is one of the MOST tested topics** in the **AWS Certified Cloud Practitioner (CLF-C02)** exam.
I'll explain it **clearly, conceptually, and with exam scenarios**, and I will **always include full forms** for AWS services.

🌍 Domain 3: Cloud Technology and Services

Task Statement 3.2: Define the AWS Global Infrastructure

🧠 SUMMARY NOTES (Big Picture)

- AWS global infrastructure is designed for **high availability, fault tolerance, and low latency**
- It is made up of:
  - **Regions**
  - **Availability Zones (AZs)**
  - **Edge Locations**
  - **AWS Local Zones**
  - **AWS Wavelength Zones**
- Customers choose **where** to deploy workloads based on:
  - Availability
  - Latency
  - Compliance
  - Disaster recovery

🌐 AWS REGIONS

📍 What is an AWS Region?

An **AWS Region** is a **geographic area** that contains **multiple Availability Zones**.

Examples:

- Asia Pacific (Mumbai)
- US East (N. Virginia)
- Europe (Frankfurt)

Key characteristics:

- Completely independent
- Isolated from other Regions
- Designed for fault tolerance

📌 **Exam keyword:**
"Geographic location"

🏢 AVAILABILITY ZONES (AZs)

📍 What is an Availability Zone?

An **Availability Zone** is **one or more discrete data centers** within a Region.

Key characteristics:

- Physically separate
- Independent power, cooling, and networking
- Connected with **high-speed, low-latency links**

📌 **Exam keyword:**
"Isolated data centers"

🚨 Important Exam Rule

> **Availability Zones do NOT share single points of failure**

This means:

- A failure in one AZ does NOT affect others
- Enables **high availability**

🔄 RELATIONSHIP: REGION vs AZ vs EDGE

Component	What it is	Purpose
Region	Geographic area	Compliance, data residency
Availability Zone	Isolated data center	High availability
Edge Location	Global content delivery site	Low latency

🟢 HIGH AVAILABILITY (VERY IMPORTANT)

🔹 What is High Availability?

High availability means designing systems that:

- Continue running even if part of the system fails

- Minimize downtime

🔹 How AWS Achieves High Availability

✔ Deploy across **multiple Availability Zones**
✔ Use load balancing
✔ Replicate data across AZs

📌 **Exam scenario:**
"Application must remain available if a data center fails" → **Use multiple AZs**

🌍 MULTIPLE REGIONS – WHEN & WHY

Using **multiple AWS Regions** is more expensive but necessary for:

🔹 Disaster Recovery

- Protect against regional failures
- Backup workloads in another Region

🔹 Business Continuity

- Keep business running during outages

🔹 Low Latency

- Serve users closer to their location

🔹 Data Sovereignty

- Keep data within country borders

📌 **Exam keywords:**
"Disaster recovery", "data residency", "global users"

⚡ EDGE LOCATIONS

📍 What is an Edge Location?

An **Edge Location** is a site used to deliver content closer to users.

Purpose:

- Reduce latency
- Improve performance

🌐 Amazon CloudFront

Full Form: Amazon **CloudFront**

What it is:

- A **Content Delivery Network (CDN)**

What it does:

- Caches content at edge locations
- Delivers data faster to users

📌 **Exam keywords:**
"Cached content", "low latency delivery"

🚀 AWS Global Accelerator

Full Form: AWS **Global Accelerator**

What it does:

- Improves availability and performance
- Routes traffic through AWS global network

📌 **Exam keywords:**
"Performance optimization", "static IPs"

📡 AWS LOCAL ZONES

📍 What are AWS Local Zones?

AWS Local Zones place AWS services **closer to large cities**.

Use cases:

- Latency-sensitive applications
- Gaming
- Media rendering
- AR/VR

📌 **Exam keyword:**
"Single-digit millisecond latency"

📶 AWS WAVELENGTH ZONES

📍 What are AWS Wavelength Zones?

AWS Wavelength Zones bring AWS services **to 5G networks**.

Use cases:

- 5G applications
- IoT
- Real-time analytics
- Autonomous vehicles

📌 **Exam keyword:**
"Ultra-low latency", "5G"

🧠 EXAM COMPARISON TABLE

Component	Main Benefit	Example
Region	Geographic isolation	Disaster recovery
Availability Zone	High availability	Fault tolerance
Edge Location	Low latency delivery	CloudFront
Local Zone	City-level low latency	Gaming
Wavelength Zone	5G ultra-low latency	IoT

🎯 COMMON EXAM SCENARIOS

Scenario 1

“Design for high availability”
✔ Multiple Availability Zones

Scenario 2

“Protect against regional outage”
✔ Multiple Regions

Scenario 3

“Deliver static content globally”
✔ Amazon CloudFront

Scenario 4

“Low-latency applications near metro areas”
✔ AWS Local Zones

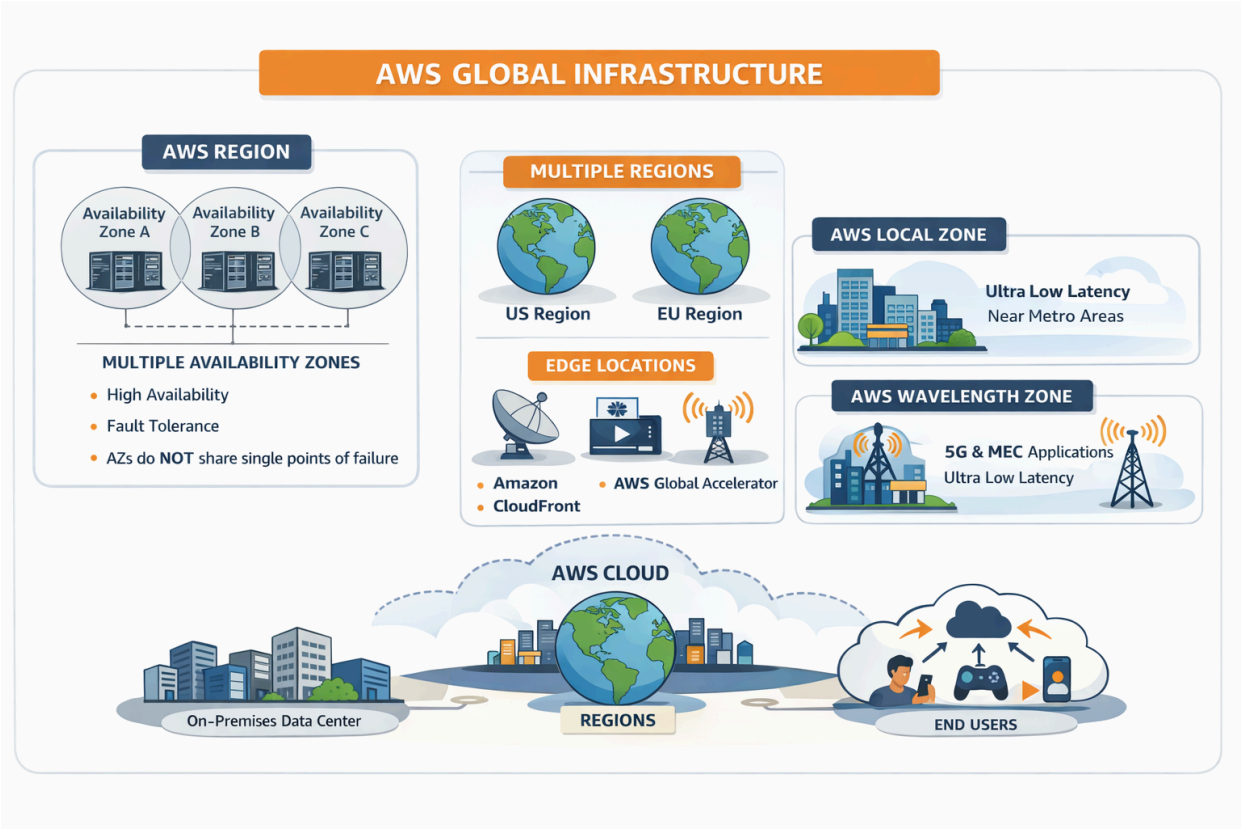
Scenario 5

“5G edge computing”
✔ AWS Wavelength Zones

🧠 MEMORY TRICKS (VERY USEFUL)

- **Region = Country/Area**
- **AZ = Building**
- **Edge = Delivery point**
- **Local Zone = City**
- **Wavelength = 5G**

- **High availability = Multiple AZs**
- **Disaster recovery = Multiple Regions**



🔥 Exam-Trap MCQs (AWS Global Infrastructure)

Q1.

Which AWS component is designed to ensure that a failure in one does **NOT** impact another?

A. AWS Region
B. AWS Edge Location
C. AWS Availability Zone
D. AWS Local Zone

Q2.

A company wants to deploy an application that must remain available even if an entire data center fails. Which AWS design best meets this requirement?

A. Deploy resources in multiple AWS Regions
B. Deploy resources in multiple AWS Availability Zones within one Region
C. Deploy resources in multiple edge locations
D. Deploy resources in AWS Local Zones only

Q3.

Which statement about AWS Regions is **TRUE**?

A. Regions consist of multiple edge locations only
B. Regions are connected by private, low-latency fiber
C. Regions contain one Availability Zone
D. Regions are isolated geographic areas containing multiple Availability Zones

---

Q4.

Which AWS service primarily uses **edge locations** to reduce latency for end users?

A. Amazon Elastic Compute Cloud (Amazon EC2)
B. Amazon Simple Storage Service (Amazon S3)
C. Amazon CloudFront
D. Amazon Relational Database Service (Amazon RDS)

Q5.

Which AWS infrastructure component is best suited for **data sovereignty and disaster recovery** requirements?

A. Availability Zones
B. Edge locations
C. Multiple AWS Regions
D. AWS Wavelength Zones

Q6.

Which statement about **Availability Zones (AZs)** is correct?

A. AZs share the same power and networking infrastructure
B. AZs are separate data centers within a Region with independent power and networking
C. AZs are located in different Regions
D. AZs are used only for content delivery

Q7.

Which AWS service improves **global application performance** by routing traffic to the closest healthy endpoint?

A. Amazon CloudFront
B. AWS Global Accelerator
C. AWS Direct Connect
D. AWS Site-to-Site VPN

Q8.

A company needs **ultra-low latency (single-digit milliseconds)** for mobile applications such as gaming and live video streaming. Which AWS infrastructure option is MOST appropriate?

A. AWS Local Zones
B. AWS Regions
C. AWS Wavelength Zones
D. AWS Edge Locations

Q9.

Which of the following BEST describes **AWS Local Zones**?

A. Locations used only for caching static content
B. Extensions of AWS Regions placed close to large metropolitan areas
C. Physical data centers in different continents
D. Mobile network data centers used for 5G workloads

Q10.

Which design choice helps ensure **high availability WITHOUT using multiple Regions**?

A. Deploying resources in multiple edge locations
B. Deploying resources in multiple Availability Zones
C. Using AWS Wavelength Zones
D. Using AWS Global Accelerator only

✅ Answers & Explanations

Q	Correct Answer	Why (Exam Tip)
1	**C**	Availability Zones are isolated to avoid single points of failure
2	**B**	High availability within one Region = multiple AZs
3	**D**	Regions = geographic areas with multiple AZs
4	**C**	Amazon CloudFront uses edge locations
5	**C**	Disaster recovery & data sovereignty require multiple Regions
6	**B**	AZs are isolated with independent infrastructure
7	**B**	AWS Global Accelerator routes traffic to closest healthy endpoint
8	**C**	AWS Wavelength Zones are built for ultra-low latency 5G workloads

9	**B**	AWS Local Zones extend Regions closer to users
10	**B**	Multi-AZ = high availability without multi-Region

Task Statement 3.3: Identify AWS compute services.

Knowledge of:
• AWS compute services
Version 1.0 CLF-C02 9 | PAGE
Skills in:
• Recognizing the appropriate use of different EC2 instance types (for example, compute optimized, storage optimized)
• Recognizing the appropriate use of different container options (for example, Amazon ECS, Amazon EKS)
• Recognizing the appropriate use of different serverless compute options (for example, AWS Fargate, Lambda)
• Recognizing that auto scaling provides elasticity
• Identifying the purposes of load balancers

Great — **Task 3.3 is a CORE scoring area** in **AWS Certified Cloud Practitioner (CLF-C02)**. I'll explain this **step-by-step**, with **clear use cases, comparisons, and exam traps**, and I'll **always include full forms** of AWS services.

⚙️ Domain 3: Cloud Technology and Services

Task Statement 3.3: Identify AWS Compute Services

🧠 WHAT ARE “COMPUTE SERVICES” IN AWS?

Compute services allow you to:

- Run applications
- Process data
- Execute code
- Handle user requests

AWS offers **multiple compute models**, so you can choose **how much control vs automation** you want.

Think of it as a **spectrum**:

> **More control → More management → More responsibility**
> **Less control → Less management → More automation**

1️⃣ AMAZON EC2 (Elastic Compute Cloud)

🌐 Full Form

Amazon EC2 – Elastic Compute Cloud

📌 What is Amazon EC2?

Amazon EC2 provides **virtual machines (servers)** in the cloud.

You are responsible for:

- Operating system
- Patching & updates
- Installed software
- Security configuration

AWS is responsible for:

- Physical servers

- Data centers
- Networking hardware

📌 **Exam keyword:**

> "Virtual server"

🧩 EC2 INSTANCE TYPES (VERY HEAVILY TESTED)

AWS offers **different instance families** optimized for different workloads.

🧮 Compute Optimized EC2

Purpose: High CPU performance

Used for:

- Scientific modeling
- High-performance computing
- Batch processing
- Gaming servers

📌 Exam phrase:

> "CPU-intensive workload"

🧠 Memory Optimized EC2

Purpose: Large memory capacity

Used for:

- In-memory databases
- Real-time analytics
- Big data processing

📌 Exam phrase:

> "Large memory requirements"

💾 Storage Optimized EC2

Purpose: High disk performance (IOPS)

Used for:

- NoSQL databases
- Data warehousing
- Log processing

📌 Exam phrase:

> "High I/O performance"

⚖️ General Purpose EC2

Purpose: Balanced CPU, memory, networking

Used for:

- Web servers
- Application servers
- Small databases

📌 Exam phrase:

> "Balanced workload"

🚨 Exam Trap

> EC2 ≠ serverless
> EC2 = **you manage the server**

2️⃣ CONTAINER COMPUTE SERVICES

Containers package:

- Application code
- Runtime
- Libraries
- Dependencies

They are:

- Lightweight
- Portable
- Faster than virtual machines

🐳 AMAZON ECS (Elastic Container Service)

🌐 Full Form

Amazon ECS – Elastic Container Service

📌 What is Amazon ECS?

A **fully managed container orchestration service** by AWS.

- AWS manages control plane
- You deploy containers
- Tight integration with AWS services

📌 Best for:

- AWS-native container workloads
- Teams new to containers

📌 Exam clue:

> "Simplified container management"

☸️ AMAZON EKS (Elastic Kubernetes Service)

🌐 Full Form

Amazon EKS – Elastic Kubernetes Service

📌 What is Amazon EKS?

A **managed Kubernetes service**.

- Uses standard Kubernetes
- More complex than ECS
- Portable across clouds

📌 Best for:

- Kubernetes experience
- Hybrid or multi-cloud strategies

📌 Exam clue:

> "Managed Kubernetes"

🧠 ECS vs EKS (Exam Favorite)

Feature	Amazon ECS	Amazon EKS
Orchestrator	AWS-native	Kubernetes
Complexity	Low	High
Portability	AWS only	Multi-cloud
Learning curve	Easy	Steep

3️⃣ SERVERLESS COMPUTE OPTIONS

Serverless means:

- No server management
- Automatic scaling
- Pay only for usage

⚡ AWS LAMBDA

🌐 Full Form

AWS Lambda

📌 What is AWS Lambda?

Runs code **in response to events** without managing servers.

AWS Lambda runs code **without provisioning or managing servers**.

- Event-driven
- Auto-scaling
- Pay per execution

📌 Execution limit:

- **Maximum 15 minutes**

📌 Best for:

- APIs
- Event processing
- Automation

📌 Exam phrases:

> “No servers”
> “Event-driven”
> “Pay per request”

🧱 AWS FARGATE

🌐 Full Form

AWS Fargate

📌 What is AWS Fargate?

A **serverless compute engine for containers**.

- Works with Amazon ECS & Amazon EKS
- No EC2 instances to manage
- You manage only containers

📌 Best for:

- Containers without server management

📌 Exam phrase:

> "Serverless containers"

🔑 Lambda vs Fargate (Exam Trap)

Feature	AWS Lambda	AWS Fargate
Workload	Functions	Containers
Duration	Short-running	Long-running
Server management	None	None
Scaling	Automatic	Automatic

4️⃣ AUTO SCALING (Elasticity)

🔄 Amazon EC2 Auto Scaling

📌 What is Auto Scaling?

Automatically **adds or removes EC2 instances** based on demand.

📌 Benefits:

- High availability
- Cost optimization
- Elasticity

📌 Exam keyword:

> "Elasticity"

🧠 Elasticity vs Scalability (VERY IMPORTANT)

Term	Meaning
Scalability	Ability to increase capacity
Elasticity	Automatic scaling up & down

📌 Exam trap:

> Elasticity = **automatic**

5️⃣ LOAD BALANCERS

⚖️ Elastic Load Balancing (ELB)

🌐 Full Form

Elastic Load Balancing

📌 What does a Load Balancer do?

- Distributes incoming traffic
- Improves availability
- Prevents overload

📌 Exam phrase:

> "Distributes traffic across multiple targets"

Types (High-level, exam relevant)

Load Balancer	Best For
Application Load Balancer (ALB)	HTTP / HTTPS
Network Load Balancer (NLB)	Low-latency TCP
Classic Load Balancer	Legacy

🧠 HOW AWS EXPECTS YOU TO THINK (EXAM MINDSET)

Match scenario → service

Scenario	Service
Virtual server	Amazon EC2
CPU-heavy workload	Compute optimized EC2
Containers (AWS native)	Amazon ECS
Kubernetes	Amazon EKS
Event-driven code	AWS Lambda
Serverless containers	AWS Fargate
Traffic spikes	Auto Scaling
Distribute traffic	Load Balancer

🧠 FINAL MEMORY SHORTCUTS

- **EC2 = Virtual machines**

- **ECS = AWS containers**
- **EKS = Kubernetes**
- **Lambda = Functions**
- **Fargate = Serverless containers**
- **Auto Scaling = Elasticity**
- **Load Balancer = Traffic distribution**

🔥 Exam-Trap MCQs — AWS Compute Services

Q1.

A workload requires **high CPU performance** and performs intensive mathematical calculations. Which Amazon EC2 instance family is MOST appropriate?

A. Memory optimized
B. Storage optimized
C. Compute optimized
D. General purpose

Q2.

Which AWS service allows you to run **code in response to events** without provisioning or managing servers?

A. Amazon Elastic Compute Cloud (Amazon EC2)
B. AWS Fargate
C. Amazon Elastic Container Service (Amazon ECS)
D. AWS Lambda

Q3.

A company wants to deploy containers using **standard Kubernetes** with the ability to run workloads across multiple environments. Which AWS service should they choose?

A. Amazon Elastic Container Service (Amazon ECS)
B. AWS Fargate
C. Amazon Elastic Kubernetes Service (Amazon EKS)
D. AWS Lambda

Q4.

Which AWS compute option is considered **serverless but still runs containers**?

A. Amazon Elastic Compute Cloud (Amazon EC2)
B. Amazon Elastic Container Service (Amazon ECS)
C. Amazon Elastic Kubernetes Service (Amazon EKS)
D. AWS Fargate

Q5.

A web application experiences unpredictable traffic spikes. Which AWS feature automatically adjusts compute capacity to meet demand?

A. Elastic Load Balancing
B. Amazon EC2 Auto Scaling
C. Amazon CloudFront
D. AWS Global Accelerator

Q6.

Which AWS service distributes incoming application traffic across multiple targets to improve availability?

A. Amazon EC2 Auto Scaling
B. AWS Lambda
C. Elastic Load Balancing
D. Amazon Route 53

Q7.

A workload requires **very high disk input/output operations per second (IOPS)**. Which Amazon EC2 instance type should be selected?

A. Compute optimized
B. Memory optimized
C. Storage optimized
D. General purpose

Q8.

Which statement about **elasticity** in AWS is TRUE?

A. Elasticity refers to manual capacity planning
B. Elasticity allows automatic scaling based on demand
C. Elasticity applies only to storage services
D. Elasticity requires multiple AWS Regions

Q9.

A developer wants to deploy containers with **minimal operational overhead** and prefers AWS-managed orchestration without Kubernetes complexity. Which service is MOST appropriate?

A. Amazon Elastic Kubernetes Service (Amazon EKS)
B. Amazon Elastic Container Service (Amazon ECS)
C. Amazon EC2 Auto Scaling
D. AWS Lambda

Q10.

Which AWS compute service is BEST suited for **short-running tasks** with a maximum execution time of **15 minutes**?

A. Amazon EC2
B. AWS Lambda
C. AWS Fargate
D. Amazon ECS

✅ Answers (With Exam Reasoning)

Q	Correct Answer	Key Exam Logic
1	**C**	Compute optimized = CPU-intensive workloads
2	**D**	AWS Lambda = event-driven, no servers
3	**C**	Amazon EKS = managed Kubernetes
4	**D**	AWS Fargate = serverless containers
5	**B**	Auto Scaling provides elasticity
6	**C**	Load balancers distribute traffic
7	**C**	Storage optimized = high IOPS
8	**B**	Elasticity = automatic scale up/down
9	**B**	Amazon ECS = simpler AWS-native containers
10	**B**	Lambda has a 15-minute execution limit

🚨 Common Exam Traps to Remember

❌ Lambda ≠ containers
❌ Fargate ≠ virtual machines
❌ Auto Scaling ≠ load balancing
❌ ECS ≠ Kubernetes
✔ Elasticity = **automatic** scaling
✔ High CPU → Compute optimized EC2
✔ High disk → Storage optimized EC2

Task Statement 3.4: Identify AWS database services.

Knowledge of:
• AWS database services
• Database migration
Skills in:
• Deciding when to use EC2 hosted databases or AWS managed databases

• Identifying relational databases (for example, Amazon RDS, Amazon Aurora)
• Identifying NoSQL databases (for example, DynamoDB)
• Identifying memory-based databases
• Identifying database migration tools (for example AWS Database Migration Service [AWS DMS], AWS Schema Conversion Tool [AWS SCT])

Great choice 👍
Task 3.4 (Databases) is very **high-yield** in the **AWS Certified Cloud Practitioner (CLF-C02)** exam.

Below is a **clear, descriptive, exam-focused explanation** of **ALL database services and tools** referenced in this topic, with **full forms**, **use cases**, and **how AWS tests them**.

🗄️ Domain 3: Cloud Technology and Services

Task Statement 3.4: Identify AWS Database Services

🧠 BIG PICTURE: DATABASES IN AWS

AWS offers **multiple database types** so you can choose based on:

- Data structure
- Performance
- Scalability
- Management effort

The exam tests:
✔ **Which database type fits which use case**
✔ **Managed vs self-managed databases**
✔ **Migration tools and when to use them**

1️⃣ EC2-HOSTED DATABASES vs AWS MANAGED DATABASES

🖥️ EC2-HOSTED DATABASES

📌 What does this mean?

You run a database **on an Amazon EC2 (Elastic Compute Cloud) instance**.

You are responsible for:

- Database installation
- Patching and updates
- Backups
- High availability
- Scaling

📌 When used:

- Custom database engines
- Full OS/database control needed
- Legacy applications

🚨 Exam Insight:

> **More control = more responsibility**

☁️ AWS MANAGED DATABASES

📌 What does managed mean?

AWS handles:

- Hardware
- Patching
- Backups
- Replication
- High availability

You focus on:

- Data
- Queries
- Application logic

📌 Exam Insight:

> **Managed services reduce operational overhead**

2️⃣ RELATIONAL DATABASE SERVICES

Relational databases:

- Use tables, rows, columns
- Use SQL (Structured Query Language)
- Have fixed schemas

🗃️ AMAZON RDS (Relational Database Service)

🌐 Full Form

Amazon RDS – Relational Database Service

📌 What is Amazon RDS?

A **fully managed relational database service**.

Supports multiple engines:

- MySQL
- PostgreSQL
- Oracle
- SQL Server
- MariaDB

AWS manages:

- Backups
- Patching
- Failover
- High availability

📌 Best for:

- Traditional applications
- Web and enterprise apps

📌 Exam phrase:

> "Managed relational database"

🚀 AMAZON AURORA

🌐 Full Form

Amazon Aurora

📌 What is Amazon Aurora?

A **cloud-native relational database** compatible with:

- MySQL
- PostgreSQL

Key features:

- Higher performance than standard RDS engines
- Automatic scaling
- Highly fault tolerant

📌 Best for:

- High performance applications
- Mission-critical workloads

📌 Exam phrase:

> "High availability and performance"

🧠 RDS vs Aurora (Exam Favorite)

Feature	Amazon RDS	Amazon Aurora
Engine	Multiple engines	MySQL/PostgreSQL compatible
Performance	Standard	Higher
Scalability	Manual/limited	Automatic
Availability	Multi-AZ	Built-in fault tolerance

3️⃣ NoSQL DATABASE SERVICES

NoSQL databases:

- Schema-less
- Key-value or document based
- Highly scalable

⚡ AMAZON DYNAMODB

🌐 Full Form

Amazon DynamoDB

📌 What is Amazon DynamoDB?

A **fully managed NoSQL key-value database**.

Features:

- Serverless
- Automatic scaling
- Millisecond latency
- Global tables support

📌 Best for:

- High traffic applications
- Gaming
- IoT
- Mobile apps

📌 Exam phrase:

> "Serverless NoSQL database"

🚨 Exam Trap:

> DynamoDB ≠ relational
> DynamoDB ≠ SQL

4️⃣ MEMORY-BASED DATABASES

Memory-based databases store data **in memory (RAM)** for **very fast access**.

⚡ AMAZON ELASTICACHE

🌐 Full Form

Amazon ElastiCache

📌 What is Amazon ElastiCache?

A **fully managed in-memory data store**.

Supports:

- Redis
- Memcached

📌 Best for:

- Caching
- Session storage
- Real-time analytics

📌 Exam phrase:

> "In-memory database"

5️⃣ DATABASE MIGRATION TOOLS (VERY IMPORTANT)

🔄 AWS DATABASE MIGRATION SERVICE (AWS DMS)

🌐 Full Form

AWS DMS – Database Migration Service

📌 What is AWS DMS?

Migrates databases with **minimal downtime**.

Supports:

- Homogeneous migrations (same engine)
- Heterogeneous migrations (different engines)

📌 Example:
On-premises Oracle → Amazon RDS

📌 Exam phrase:

> "Minimal downtime migration"

🛠️ AWS SCHEMA CONVERSION TOOL (AWS SCT)

🌐 Full Form

AWS SCT – Schema Conversion Tool

📌 What is AWS SCT?

Converts database schema from one engine to another.

Used when:

- Migrating from commercial DBs to open-source DBs
- Oracle → MySQL / Aurora

📌 Exam phrase:

> "Schema conversion"

🧠 DMS vs SCT (Exam Trap)

Tool	Purpose
AWS DMS	Moves data
AWS SCT	Converts schema

✔ **Often used together**

🧠 HOW AWS TESTS THIS TOPIC

Scenario → Correct Service

Scenario	Service
Managed relational DB	Amazon RDS
High-performance relational DB	Amazon Aurora
Serverless NoSQL	Amazon DynamoDB

In-memory caching	Amazon ElastiCache
Minimal downtime migration	AWS DMS
Schema conversion	AWS SCT
Full DB control	EC2-hosted DB

🚨 COMMON EXAM TRAPS

❌ DynamoDB ≠ relational
❌ RDS ≠ NoSQL
❌ EC2-hosted DB ≠ managed
❌ DMS ≠ schema conversion
✔ Managed DBs = less admin work

🧠 ONE-LINE MEMORY HACKS

- **RDS = Managed relational**
- **Aurora = High-performance relational**
- **DynamoDB = Serverless NoSQL**
- **ElastiCache = In-memory**
- **DMS = Data migration**
- **SCT = Schema conversion**

🔥 Exam-Trap MCQs — AWS Database Services (Task 3.4)

Q1.

Which AWS service provides a **fully managed relational database** that supports MySQL, PostgreSQL, Oracle, and SQL Server?

A. Amazon DynamoDB
B. Amazon Aurora

C. Amazon Relational Database Service (Amazon RDS)
D. Amazon Elastic Compute Cloud (Amazon EC2)

Q2.

A company needs a **serverless NoSQL database** with **single-digit millisecond latency** and automatic scaling. Which service should they use?

A. Amazon Aurora
B. Amazon Relational Database Service (Amazon RDS)
C. Amazon DynamoDB
D. Amazon ElastiCache

Q3.

Which AWS database service is **compatible with MySQL and PostgreSQL** and designed for **high performance and high availability**?

A. Amazon Relational Database Service (Amazon RDS)
B. Amazon Aurora
C. Amazon DynamoDB
D. Amazon ElastiCache

Q4.

A company requires **full control over the database engine and operating system**. Which option should they choose?

A. Amazon RDS
B. Amazon Aurora
C. Amazon DynamoDB
D. Database hosted on Amazon EC2

Q5.

Which AWS service is BEST suited for **caching data in memory** to reduce database load and improve application performance?

A. Amazon DynamoDB
B. Amazon Relational Database Service (Amazon RDS)
C. Amazon ElastiCache
D. Amazon Aurora

Q6.

Which AWS service helps migrate databases to AWS with **minimal downtime**?

A. AWS Schema Conversion Tool (AWS SCT)
B. AWS Database Migration Service (AWS DMS)
C. Amazon Aurora
D. Amazon EC2 Auto Scaling

Q7.

A company is migrating from an on-premises Oracle database to Amazon Aurora. Which AWS tool is used to **convert the database schema**?

A. AWS Database Migration Service (AWS DMS)
B. AWS Schema Conversion Tool (AWS SCT)
C. Amazon DynamoDB
D. Amazon ElastiCache

Q8.

Which statement about **Amazon DynamoDB** is TRUE?

A. It is a relational database service
B. It requires manual scaling
C. It is a fully managed NoSQL database
D. It runs only on Amazon EC2

Q9.

Which AWS database option **reduces operational overhead** by handling backups, patching, and failover automatically?

A. Self-managed database on Amazon EC2
B. AWS managed database services
C. On-premises databases
D. Third-party databases from AWS Marketplace

Q10.

Which combination of tools is commonly used together for **heterogeneous database migration**?

A. Amazon RDS and Amazon DynamoDB
B. Amazon EC2 and Amazon Aurora
C. AWS Database Migration Service (AWS DMS) and AWS Schema Conversion Tool (AWS SCT)
D. Amazon ElastiCache and Amazon DynamoDB

✅ Answers with Exam Logic

Q	Correct Answer	Key Reason
1	**C**	Amazon RDS is the managed relational database service
2	**C**	DynamoDB is serverless NoSQL with auto scaling
3	**B**	Aurora offers higher performance & availability
4	**D**	EC2-hosted DB gives full OS & DB control
5	**C**	ElastiCache is an in-memory database
6	**B**	AWS DMS supports minimal downtime migration
7	**B**	AWS SCT converts database schema
8	**C**	DynamoDB is fully managed NoSQL
9	**B**	Managed services reduce admin effort
10	**C**	DMS moves data, SCT converts schema

🚨 Common Exam Traps to Avoid

❌ DynamoDB ≠ relational
❌ DMS ≠ schema conversion
❌ EC2-hosted DB ≠ managed
✔ Aurora ≠ regular MySQL (cloud-optimized)
✔ ElastiCache = memory-based

Task Statement 3.5: Identify AWS network services.

Knowledge of:
• AWS network services
Skills in:
• Identifying the components of a VPC (for example, subnets, gateways)
• Understanding security in a VPC (for example, network ACLs, security groups)
• Understanding the purpose of Amazon Route 53
• Identifying edge services (for example, CloudFront, Global Accelerator)
• Identifying network connectivity options to AWS (for example AWS VPN, Direct Connect)

Great 👍
Task 3.5 (Networking) is one of the most **concept-heavy** areas in the **AWS Certified Cloud Practitioner (CLF-C02)** exam. AWS expects you to **recognize services, understand purposes, and avoid common traps** — not design networks.

Below is a **clear, descriptive, exam-focused explanation** of **ALL AWS services and concepts referenced**, with **full forms**, **use cases**, and **how they appear in exam questions**.

🌐 Domain 3: Cloud Technology and Services

Task Statement 3.5: Identify AWS Network Services

🧠 BIG PICTURE: NETWORKING IN AWS

AWS networking answers these questions:

- How do resources communicate?
- How is traffic controlled and secured?
- How do users reach applications globally?
- How does on-premises connect to AWS?

The exam tests:
✔ **VPC basics**
✔ **Security controls (Security Groups vs NACLs)**
✔ **DNS and traffic routing**
✔ **Edge services**
✔ **Connectivity options**

1️⃣ AMAZON VPC (Virtual Private Cloud)

🌐 Full Form

Amazon VPC – Virtual Private Cloud

📌 What is Amazon VPC?

Amazon VPC lets you create a **logically isolated private network** in AWS.

Think of it as:

> **Your own data center network in the AWS Cloud**

You control:

- IP address range
- Subnets
- Routing
- Security

📌 Exam phrase:

> "Logically isolated network"

🧩 CORE COMPONENTS OF A VPC (VERY IMPORTANT)

🟦 Subnets

A **subnet** is a portion of a VPC's IP range.

Types:

- **Public subnet** → has internet access
- **Private subnet** → no direct internet access

📌 Exam clue:

> "Public-facing resources" → public subnet
> "Backend databases" → private subnet

🚪 Internet Gateway (IGW)

Internet Gateway allows communication between:

- Resources in a VPC
- The public internet

📌 Exam trap:

> No Internet Gateway = **no internet access**

🔁 NAT Gateway (Network Address Translation Gateway)

NAT Gateway allows:

- Resources in a private subnet
- To access the internet **outbound only**

📌 Used for:

- Software updates
- Patch downloads

📌 Exam phrase:

> “Private resources need internet access but should not be publicly reachable”

2️⃣ SECURITY IN A VPC (VERY HEAVILY TESTED)

🔐 SECURITY GROUPS

📌 What is a Security Group?

A **Security Group** acts as a **virtual firewall** for resources (EC2, RDS).

Key characteristics:

- **Stateful**
- Controls inbound & outbound traffic
- Applied at the **instance level**

📌 Exam phrase:

> “Instance-level firewall”

🚧 NETWORK ACLs (Access Control Lists)

🌐 Full Form

NACL – Network Access Control List

📌 What is a Network ACL?

A **Network ACL** controls traffic **at the subnet level**.

Key characteristics:

- **Stateless**
- Explicit allow & deny rules
- Applies to all resources in a subnet

📌 Exam phrase:

> "Subnet-level security"

🔑 Security Group vs Network ACL (TOP EXAM TRAP)

Feature	Security Group	Network ACL
Level	Instance	Subnet
Stateful	Yes	No
Rules	Allow only	Allow & deny

✔ If traffic is allowed inbound, SG allows outbound automatically
❌ NACL requires rules in both directions

3️⃣ AMAZON ROUTE 53 (DNS SERVICE)

🌐 Full Form

Amazon Route 53

📌 What is Amazon Route 53?

Amazon Route 53 is a **scalable Domain Name System (DNS) web service**.

It:

- Translates domain names to IP addresses
- Routes users to applications
- Supports health checks

📌 Exam phrase:

“DNS service” or “Domain name routing”

📌 Example:

www.example.com → Application Load Balancer

4️⃣ EDGE NETWORK SERVICES

Edge services improve:

- Performance
- Availability
- Global reach

🌍 AMAZON CLOUDFRONT

🌐 Full Form

Amazon CloudFront

📌 What is Amazon CloudFront?

A **Content Delivery Network (CDN)**.

It:

- Caches content at edge locations
- Reduces latency
- Improves user experience

📌 Used for:

- Static websites
- Media streaming
- APIs

📌 Exam phrase:

> “Low latency content delivery”

🚀 AWS GLOBAL ACCELERATOR

🌐 Full Form

AWS Global Accelerator

📌 What is AWS Global Accelerator?

Improves performance for:

- Dynamic content
- TCP/UDP traffic

Uses:

- AWS global network
- Static anycast IPs

📌 Exam phrase:

> “Improves availability and performance for global users”

🔑 CloudFront vs Global Accelerator (Exam Favorite)

Feature	CloudFront	Global Accelerator
Content	Static & dynamic	Dynamic only
Caching	Yes	No
Protocols	HTTP/HTTPS	TCP/UDP

5️⃣ CONNECTIVITY OPTIONS TO AWS

🔐 AWS VPN

🌐 Full Form

AWS Virtual Private Network (VPN)

📌 What is AWS VPN?

Creates a **secure encrypted connection** over the public internet between:

- On-premises network
- Amazon VPC

📌 Used for:

- Hybrid cloud
- Lower cost connectivity

📌 Exam phrase:

> "Encrypted connection over the internet"

🔌 AWS DIRECT CONNECT

🌐 Full Form

AWS Direct Connect

📌 What is AWS Direct Connect?

A **dedicated private network connection** between:

- On-premises data center
- AWS

📌 Benefits:

- Consistent bandwidth
- Low latency
- High throughput

📌 Exam phrase:

> "Dedicated private connection"

🔑 VPN vs Direct Connect (VERY COMMON TRAP)

Feature	AWS VPN	AWS Direct Connect
Network	Public internet	Private
Encryption	Yes	Optional
Latency	Higher	Lower
Cost	Lower	Higher

🧠 HOW AWS TESTS THIS TOPIC

Scenario → Service Mapping

Scenario	Correct Service
Isolated cloud network	Amazon VPC
Instance-level firewall	Security Group
Subnet-level security	Network ACL
Domain name routing	Amazon Route 53
Faster static content	Amazon CloudFront
Low-latency global apps	AWS Global Accelerator
Encrypted hybrid connection	AWS VPN
Dedicated private connection	AWS Direct Connect

🚨 COMMON EXAM TRAPS

❌ Security Groups ≠ subnet-level
❌ NACLs ≠ stateful
❌ CloudFront ≠ DNS
❌ Route 53 ≠ CDN
✔ Direct Connect ≠ internet-based
✔ VPN ≠ dedicated connection

🧠 ONE-LINE MEMORY HACKS

- **VPC = Private network**
- **Subnet = Network segment**
- **Security Group = Instance firewall**
- **NACL = Subnet firewall**
- **Route 53 = DNS**
- **CloudFront = CDN**
- **Global Accelerator = Fast global traffic**
- **VPN = Encrypted internet connection**
- **Direct Connect = Private connection**

🔥 EXAM-TRAP MCQs (AWS Networking)

Q1

Which AWS service provides a **logically isolated virtual network**?

A. Amazon Route 53
B. Amazon CloudFront
C. Amazon Virtual Private Cloud (Amazon VPC)
D. AWS Direct Connect

Q2

Which component allows resources in a **private subnet** to access the internet **without being publicly accessible**?

A. Internet Gateway
B. NAT Gateway
C. Security Group
D. Network ACL

Q3

Which AWS security feature is **stateful**?

A. Network ACL
B. AWS WAF
C. Security Group
D. Amazon Route 53

Q4

Which AWS service routes users to the **closest edge location** to reduce latency for static content?

A. AWS Global Accelerator
B. Amazon Route 53
C. Amazon CloudFront
D. AWS Direct Connect

Q5

Which AWS service provides **DNS resolution** for domain names?

A. Amazon CloudFront
B. Amazon Route 53
C. Elastic Load Balancing
D. AWS Global Accelerator

Q6

Which statement about **Network ACLs** is TRUE?

A. They are stateful
B. They apply at the instance level
C. They support allow and deny rules
D. They replace security groups

Q7

Which AWS connectivity option provides the **lowest latency and consistent bandwidth**?

A. AWS VPN
B. Public internet
C. AWS Direct Connect
D. Amazon CloudFront

Q8

Which AWS service improves performance for **dynamic global applications** using static IP addresses?

A. Amazon CloudFront
B. Amazon Route 53
C. AWS Global Accelerator
D. Elastic Load Balancing

Q9

Which AWS service acts as a **firewall at the subnet level**?

A. Security Group
B. Network ACL
C. AWS Shield
D. AWS WAF

Q10

Which combination is BEST for a **hybrid cloud with encryption over the internet**?

A. AWS Direct Connect
B. Amazon CloudFront
C. AWS VPN
D. AWS Global Accelerator

✅ ANSWERS (WITH EXAM LOGIC)

Q	Answer	Reason
1	**C**	VPC = isolated cloud network
2	**B**	NAT Gateway = outbound-only internet
3	**C**	Security Groups are stateful
4	**C**	CloudFront = CDN
5	**B**	Route 53 = DNS
6	**C**	NACLs allow + deny
7	**C**	Direct Connect = private, low latency
8	**C**	Global Accelerator = dynamic traffic
9	**B**	NACL = subnet firewall
10	**C**	VPN = encrypted internet connection

🚨 FINAL EXAM MEMORY TRAPS

❌ Security Groups ≠ subnet-level
❌ CloudFront ≠ DNS
❌ Route 53 ≠ CDN
❌ VPN ≠ private connection
✔ Direct Connect = private + low latency
✔ NACLs = stateless

Task Statement 3.6: Identify AWS storage services.

Knowledge of:
• AWS storage services
Skills in:
• Identifying the uses for object storage
• Recognizing the differences in Amazon S3 storage classes
• Identifying block storage solutions (for example, Amazon Elastic Block Store [Amazon EBS], instance store)
• Identifying file services (for example, Amazon Elastic File System [Amazon EFS], Amazon FSx)
• Identifying cached file systems (for example, AWS Storage Gateway)
• Understanding use cases for lifecycle policies
• Understanding use cases for AWS Backup

🗄️ Task Statement 3.6: Identify AWS Storage Services

(AWS Certified Cloud Practitioner – CLF-C02)

1️⃣ Object Storage – Amazon S3 (Amazon Simple Storage Service)

🔹 What is Object Storage?

Object storage stores data as **objects** (file + metadata + unique key).
It is designed for **massive scale**, **high durability**, and **internet access**.

🔹 Amazon S3 – Key Exam Facts

- **Highly durable (99.999999999% – 11 9s)**
- Stores data in **buckets**
- Objects are accessed using **URLs**
- **Serverless** (no capacity planning)
- Used for **static websites**, backups, media, logs, data lakes

🔹 Common Exam Use Cases

Scenario	Answer
Store images, videos, backups	Amazon S3
Static website hosting	Amazon S3
Data lake	Amazon S3
Highly durable, low-cost storage	Amazon S3

2️⃣ Amazon S3 Storage Classes (VERY EXAM-IMPORTANT)

🔹 Purpose

Different storage classes help **optimize cost** based on **access frequency**.

🔹 Key Storage Classes Explained

🟢 Amazon S3 Standard

- Frequently accessed data
- Low latency, high availability
- Higher cost

🟡 Amazon S3 Standard-IA (Infrequent Access)

- Accessed less often
- Lower cost storage
- **Retrieval fee applies**

🔵 Amazon S3 One Zone-IA

- Stored in **one Availability Zone**
- Lower cost
- Not for critical data

❄️ Amazon S3 Glacier Instant Retrieval

- Archive data
- Immediate access
- Higher storage cost than Glacier Flexible

❄️ Amazon S3 Glacier Flexible Retrieval

- Minutes to hours retrieval
- Very low cost

❄️ **Amazon S3 Glacier Deep Archive**

- Lowest cost
- Retrieval in hours
- Used for compliance & long-term archives

🔹 Exam Trap

> "Which S3 storage class is **cheapest** for long-term data rarely accessed?"

✔ **Amazon S3 Glacier Deep Archive**

3️⃣ Block Storage – Amazon EBS & Instance Store

🧱 Amazon EBS (Amazon Elastic Block Store)

🔹 **What It Is**

- **Persistent block storage**
- Attached to **Amazon EC2 (Elastic Compute Cloud)**
- Data survives EC2 stop/restart

🔹 **Key Exam Points**

- Used like a **virtual hard disk**
- Supports **snapshots**
- Stored in a **single Availability Zone**
- Used for **databases**, OS boot volumes

🔹 **When Exam Wants Amazon EBS**

Requirement	Answer
Persistent storage for EC2	Amazon EBS
Boot volume	Amazon EBS
Database storage	Amazon EBS

⚡ Instance Store

🔹 **What It Is**

- **Temporary block storage**
- Physically attached to EC2 host
- Data lost if instance stops or terminates

🔹 **Exam Keywords**

- High performance
- Temporary data
- Cache, buffers

🔹 **Exam Trap**

❌ Do NOT use Instance Store for backups
✔ Use Amazon S3 or Amazon EBS

4️⃣ File Storage – Amazon EFS & Amazon FSx

📂 Amazon EFS (Amazon Elastic File System)

🔹 **What It Is**

- **Fully managed NFS file system**
- Shared across **multiple EC2 instances**
- Automatically scales

🔹 **Key Exam Use Cases**

Scenario	Answer
Shared file system	Amazon EFS
Linux workloads	Amazon EFS
Multiple EC2s need same data	Amazon EFS

🗂️ Amazon FSx (File System x)

🔹 **What It Is**

- Managed file systems for **specific workloads**
- Variants include:
  - **Amazon FSx for Windows File Server**
  - **Amazon FSx for Lustre** (high-performance computing)

🔹 **Exam Focus**

- Windows workloads → **Amazon FSx**
- High-performance compute → **Amazon FSx for Lustre**

5️⃣ Cached File Systems – AWS Storage Gateway

🔹 What Is AWS Storage Gateway?

A **hybrid storage service** connecting **on-premises environments to AWS storage**.

🔹 Storage Gateway Types (Exam-Level)

Type	Purpose
File Gateway	Files → Amazon S3
Volume Gateway	Block storage
Tape Gateway	Backup & archive

🔹 Exam Use Case

> "On-premises applications need **low-latency access** to frequently used data, with data stored in AWS"

✔ **AWS Storage Gateway (Cached mode)**

6️⃣ Lifecycle Policies – Cost Optimization Feature

🔹 What Are Lifecycle Policies?

Rules that **automatically move objects** between storage classes.

🔹 Example

- S3 Standard → S3 Standard-IA → S3 Glacier → Delete

🔹 Exam Keywords

- Cost optimization
- Automatic transitions
- Long-term storage

✔ Used **only with Amazon S3**

7️⃣ AWS Backup – Centralized Backup Service

🔹 What Is AWS Backup?

A **fully managed backup service** that centralizes backups across AWS services.

🔹 Supports

- Amazon EBS
- Amazon RDS
- Amazon DynamoDB
- Amazon EFS
- Amazon FSx

🔹 Exam Use Case

> "Need a **centralized backup policy** across AWS services"

✔ **AWS Backup**

🚨 HIGH-PROBABILITY EXAM TRAPS

Trap	Correct Understanding
Instance Store is persistent	❌ Temporary only
Glacier is real-time access	❌ Archive

EBS spans AZs	❌ Single AZ
EFS is block storage	❌ File storage
S3 is block storage	❌ Object storage

🧠 FINAL MEMORY MAP (NO DIAGRAM)

- **Object** → Amazon S3
- **Block** → Amazon EBS
- **Temporary** → Instance Store
- **Shared Files** → Amazon EFS
- **Windows Files** → Amazon FSx
- **Hybrid Cache** → AWS Storage Gateway
- **Archive** → S3 Glacier
- **Backup** → AWS Backup
- **Cost Control** → Lifecycle Policies

Here are 🔥 **10 EXAM-TRAP MCQs** for
Task Statement 3.6 – AWS Storage Services (CLF-C02)
Written exactly in **AWS exam style**, with **tricky wording** and **common traps**.

🔥 Exam-Trap MCQs (AWS Storage Services)

Q1.

A company needs storage for **millions of images** that are accessed frequently and must be **highly durable**. The solution must be **cost-effective** and **require no server management**. Which AWS service should be used?

A. Amazon Elastic Block Store (Amazon EBS)
B. Amazon Elastic File System (Amazon EFS)
C. Amazon Simple Storage Service (Amazon S3)
D. Amazon FSx for Windows File Server

Q2.

Which Amazon S3 storage class is **MOST cost-effective** for data that must be **retained for compliance** and **rarely accessed**, with retrieval times of **several hours acceptable**?

A. Amazon S3 Standard-IA
B. Amazon S3 Glacier Instant Retrieval
C. Amazon S3 Glacier Flexible Retrieval
D. Amazon S3 Glacier Deep Archive

Q3.

A database running on Amazon EC2 (Elastic Compute Cloud) must **retain data even after the instance stops or terminates**.
Which storage option should be used?

A. Instance Store
B. Amazon Elastic Block Store (Amazon EBS)
C. Amazon S3
D. Amazon Elastic File System (Amazon EFS)

Q4.

Which statement about **Instance Store** is TRUE?

A. Data persists after EC2 instance termination
B. It is shared across multiple EC2 instances
C. It provides temporary, high-performance storage
D. It supports automated snapshots

Q5.

A Linux-based application requires a **shared file system** that can be **mounted on multiple EC2 instances simultaneously** and **automatically scales**.
Which service meets this requirement?

A. Amazon Elastic Block Store (Amazon EBS)
B. Amazon Simple Storage Service (Amazon S3)

C. Amazon Elastic File System (Amazon EFS)
D. Amazon FSx for Lustre

Q6.

Which AWS service is **BEST suited for Windows-based file sharing** workloads that require full support for **SMB protocol and Active Directory**?

A. Amazon Elastic File System (Amazon EFS)
B. Amazon FSx for Windows File Server
C. Amazon Simple Storage Service (Amazon S3)
D. AWS Storage Gateway

Q7.

An on-premises application requires **low-latency access** to frequently used data, while **less-frequently accessed data** should be stored in the AWS Cloud.
Which service is designed for this use case?

A. Amazon S3 Lifecycle Policies
B. Amazon EFS
C. AWS Storage Gateway (Cached mode)
D. Amazon Glacier Deep Archive

Q8.

A company wants to **automatically move objects** from Amazon S3 Standard to lower-cost storage tiers over time to reduce cost.
Which feature enables this?

A. AWS Backup
B. Amazon S3 Replication
C. Amazon S3 Lifecycle Policies
D. Amazon S3 Versioning

Q9.

Which AWS service provides a **centralized, policy-based backup solution** for services such as Amazon EBS, Amazon RDS, and Amazon DynamoDB?

A. Amazon S3 Glacier
B. AWS Backup
C. Amazon Elastic File System (Amazon EFS)
D. AWS Storage Gateway

Q10.

Which storage solution is **NOT suitable** for long-term data retention or backups?

A. Amazon S3
B. Amazon Elastic Block Store (Amazon EBS)
C. Instance Store
D. Amazon S3 Glacier Deep Archive

✅ ANSWERS (AT THE END)

Q	Answer
1	**C**
2	**D**
3	**B**
4	**C**
5	**C**
6	**B**
7	**C**
8	**C**
9	**B**
10	**C**

🧠 Exam Tip (VERY IMPORTANT)

If the question mentions:

- **Durability + scalability** → Amazon S3
- **Persistent EC2 storage** → Amazon EBS
- **Temporary high-speed storage** → Instance Store
- **Shared Linux file system** → Amazon EFS
- **Windows file sharing** → Amazon FSx
- **Hybrid on-prem caching** → AWS Storage Gateway
- **Cheapest archive** → Amazon S3 Glacier Deep Archive

Task Statement 3.7: Identify AWS artificial intelligence and machine learning (AI/ML) services and analytics services.

Knowledge of:
• AWS AI/ML services
• AWS analytics services
Skills in:
• Understanding the different AI/ML services and the tasks that they accomplish (for example, Amazon SageMaker, Amazon Lex, Amazon Kendra)
• Identifying the services for data analytics (for example, Amazon Athena, Amazon Kinesis, AWS Glue, Amazon QuickSight)

Below is a **clear, exam-focused, descriptive explanation** of
Task Statement 3.7 – AWS AI/ML & Analytics Services (CLF-C02)

I'll explain **each service**, **what problem it solves**, **when AWS expects you to choose it**, and **common exam traps**.
(No diagrams, as requested.)

🧠 Task Statement 3.7

Identify AWS Artificial Intelligence (AI), Machine Learning (ML), and Analytics Services

---

🔹 Big Exam Picture (Very Important)

For **Cloud Practitioner**, AWS does **NOT** expect you to:

- Build ML models
- Tune algorithms
- Write data pipelines

Instead, AWS expects you to:
✔ Recognize **which service fits which use case**
✔ Distinguish **AI services vs ML platforms vs analytics services**
✔ Answer **scenario-based questions**

🤖 AWS AI / ML SERVICES (High-level, managed intelligence)

These services allow **developers to add intelligence** to applications **without ML expertise**.

🟢 Amazon SageMaker

Full form: Amazon SageMaker

🔍 What it is

A **fully managed machine learning platform** used to:

- Build
- Train
- Tune
- Deploy
- Monitor ML models

🎯 When to use (EXAM VIEW)

Use **Amazon SageMaker** when:

- Custom ML models are required
- Data scientists or ML engineers are involved
- You want full ML lifecycle management

❌ Exam Trap

- SageMaker is **NOT** used for chatbots or search directly
- It is **NOT serverless AI like Rekognition**

🟢 Amazon Lex

Full form: Amazon Lex

🔍 What it is

A service to build **chatbots and voice assistants** using:

- Automatic Speech Recognition (ASR)
- Natural Language Understanding (NLU)

(Technology behind **Amazon Alexa**)

🎯 When to use (EXAM VIEW)

Use **Amazon Lex** for:

- Chatbots
- Voice bots
- Customer support automation

❌ Exam Trap

- Lex ≠ text analysis (that's Comprehend)
- Lex ≠ search engine (that's Kendra)

🟢 Amazon Kendra

Full form: Amazon Kendra

🔍 What it is

An **AI-powered enterprise search service**.

It searches:

- Documents
- PDFs
- Wikis
- FAQs
- Internal knowledge bases

🎯 When to use (EXAM VIEW)

Use **Amazon Kendra** when:

- Employees need intelligent search
- Searching internal documents
- Natural language questions like:
  "How do I reset my VPN?"

❌ Exam Trap

- Kendra ≠ chatbot
- Kendra ≠ database query engine

📊 AWS ANALYTICS SERVICES (Data insights & reporting)

Used to **collect, process, analyze, and visualize data**.

🔵 Amazon Athena

Full form: Amazon Athena

🔍 What it is

A **serverless SQL query service** that queries data directly in:

- Amazon Simple Storage Service (Amazon S3)

🎯 When to use (EXAM VIEW)

Use **Amazon Athena** when:

- You want to run SQL queries
- Data is stored in S3
- No infrastructure to manage
- Pay per query

❌ Exam Trap

- Athena ≠ data warehouse (that's Redshift)
- Athena ≠ streaming analytics

🔵 Amazon Kinesis

Full form: Amazon Kinesis

🔍 What it is

A platform for **real-time streaming data**.

Processes:

- IoT data
- Clickstreams
- Logs
- Video streams

🎯 When to use (EXAM VIEW)

Use **Amazon Kinesis** when:

- Data arrives continuously
- Real-time processing is required
- Low-latency ingestion

❌ Exam Trap

- Kinesis ≠ batch analytics
- Kinesis ≠ visualization tool

🔵 AWS Glue

Full form: AWS Glue

🔍 What it is

A **serverless ETL (Extract, Transform, Load)** service.

It:

- Discovers data
- Cleans and transforms it
- Loads it into analytics services

🎯 When to use (EXAM VIEW)

Use **AWS Glue** when:

- Preparing data for analytics
- Moving data between services
- Building data pipelines

❌ Exam Trap

- Glue ≠ query service
- Glue ≠ dashboard tool

🔵 Amazon QuickSight

Full form: Amazon QuickSight

🔍 What it is

A **business intelligence (BI) and visualization tool**.

Used to:

- Create dashboards
- Visualize data
- Share insights

🎯 When to use (EXAM VIEW)

Use **Amazon QuickSight** when:

- Business users need dashboards
- Visual analytics are required
- Data comes from Athena, Redshift, RDS, S3

❌ Exam Trap

- QuickSight ≠ data processing
- QuickSight ≠ data ingestion

🧠 HOW AWS EXAM LINKS THESE SERVICES

Requirement in Question	Correct AWS Service
Build custom ML models	Amazon SageMaker
Chatbots / voice bots	Amazon Lex
Intelligent document search	Amazon Kendra
SQL on S3	Amazon Athena
Real-time streaming data	Amazon Kinesis
ETL / data preparation	AWS Glue
Dashboards & visualization	Amazon QuickSight

🚨 COMMON EXAM TRAPS (VERY IMPORTANT)

❌ “AI service” does NOT always mean SageMaker
❌ Athena is **query**, not visualization
❌ QuickSight is **visualization**, not analytics engine

❌ Kinesis is **streaming**, not batch
❌ Glue is **ETL**, not querying

✅ Exam Mindset Tip

If AWS says:

- **"No ML expertise required"** → AI service (Lex, Kendra)
- **"Custom ML model"** → SageMaker
- **"SQL on S3"** → Athena
- **"Real-time data"** → Kinesis
- **"Prepare data"** → Glue
- **"Dashboards"** → QuickSight

Here are 🔥 **10 EXAM-TRAP MCQs** for
Task Statement 3.7 – AWS AI/ML & Analytics Services (CLF-C02)
Written in **real AWS exam style**, with **tricky wording** and **service confusion traps**.
✅ **Answers are at the end**.

🔥 Exam-Trap MCQs: AWS AI/ML & Analytics

Q1

A company wants to build a **custom machine learning model** to predict customer churn and manage the **entire ML lifecycle**.
Which AWS service should be used?

A. Amazon Lex (Automatic Speech Recognition service)
B. Amazon Kendra (Enterprise search service)
C. Amazon SageMaker (Machine Learning platform)
D. Amazon QuickSight (Business intelligence service)

Q2

Which AWS service allows users to **run SQL queries directly on data stored in Amazon S3** without managing servers?

A. AWS Glue (ETL service)
B. Amazon Athena (Serverless query service)
C. Amazon Redshift (Data warehouse service)
D. Amazon QuickSight (Visualization service)

Q3

A company wants to build a **chatbot** that understands natural language text and voice commands for customer support.
Which service should be used?

A. Amazon SageMaker
B. Amazon Kendra
C. Amazon Lex
D. Amazon Comprehend

Q4

Which AWS service is designed to provide **AI-powered search** across internal documents such as PDFs, manuals, and FAQs?

A. Amazon Athena
B. Amazon Lex
C. Amazon Kendra
D. Amazon QuickSight

Q5

A streaming application needs to **ingest and process real-time data** from IoT sensors with **low latency**.
Which service is MOST appropriate?

A. Amazon Athena
B. AWS Glue
C. Amazon Kinesis
D. Amazon QuickSight

Q6

Which AWS service is primarily used to **prepare, clean, and transform data** before analysis?

A. Amazon Athena
B. Amazon QuickSight
C. AWS Glue
D. Amazon Kinesis

Q7

A business analyst wants to create **interactive dashboards and visual reports** using data from Amazon Athena.
Which service should be used?

A. Amazon Kinesis
B. Amazon QuickSight
C. AWS Glue
D. Amazon SageMaker

Q8

Which statement about **Amazon SageMaker** is TRUE?

A. It is used mainly for SQL analytics
B. It is a visualization tool
C. It is a fully managed machine learning service
D. It is a real-time streaming platform

Q9

Which AWS service is BEST suited for **batch SQL analysis** of log files stored in Amazon S3?

A. Amazon Kinesis
B. Amazon Athena
C. Amazon Lex
D. Amazon Kendra

Q10

A company wants to **separate responsibilities** so that:

- One service **processes streaming data**
- Another service **visualizes business insights**

Which combination is correct?

A. Amazon Kinesis + Amazon Athena
B. AWS Glue + Amazon SageMaker
C. Amazon Kinesis + Amazon QuickSight
D. Amazon Athena + Amazon Lex

✅ ANSWERS (AT THE END)

Q	Correct Answer	Why (Exam Logic)
1	**C**	SageMaker handles full ML lifecycle
2	**B**	Athena = SQL on S3
3	**C**	Lex = chatbots & voice
4	**C**	Kendra = enterprise search
5	**C**	Kinesis = real-time streaming
6	**C**	Glue = ETL
7	**B**	QuickSight = dashboards
8	**C**	SageMaker = ML platform
9	**B**	Athena = batch SQL
10	**C**	Kinesis streams, QuickSight visualizes

🚨 Common Exam Traps to Remember

- ❌ Athena ≠ visualization
- ❌ QuickSight ≠ analytics engine
- ❌ Glue ≠ query service
- ✔ Kinesis = **real-time**
- ✔ SageMaker = **custom ML**
- ✔ Lex = **chatbots**
- ✔ Kendra = **search**

Task Statement 3.8: Identify services from other in-scope AWS service categories.

Knowledge of:
• Application integration services of Amazon EventBridge, Amazon Simple Notification Service (Amazon SNS), and Amazon Simple Queue Service (Amazon SQS)
• Business application services of Amazon Connect and Amazon Simple Email Service (Amazon SES)
• Customer engagement services of AWS Activate for Startups, AWS IQ, AWS Managed Services (AMS), and AWS Support
• Developer tool services and capabilities of AWS AppConfig, AWS Cloud9, AWS CloudShell, AWS CodeArtifact, AWS CodeBuild, AWS CodeCommit, AWS CodeDeploy, AWS CodePipeline, AWS CodeStar, and AWS X-Ray
• End-user computing services of Amazon AppStream 2.0, Amazon WorkSpaces, and Amazon WorkSpaces Web
• Frontend web and mobile services of AWS Amplify and AWS AppSync
• IoT services of AWS IoT Core and AWS IoT Greengrass

Below is a **clear, detailed, exam-oriented explanation** of
Task Statement 3.8 – Other In-Scope AWS Service Categories (CLF-C02)

I'll explain **each AWS service**, **what problem it solves**, **how it appears in the exam**, and **common confusion points**.
❌ No diagrams (as requested).
✅ Full AWS service names included.

🧠 Task Statement 3.8

Identify services from other in-scope AWS service categories

📌 Exam mindset (very important)

For **AWS Certified Cloud Practitioner**, AWS does **NOT** expect configuration details.
You must:

- Recognize the **purpose** of each service
- Match **keywords in scenarios** to the **correct service**
- Avoid confusing **similar-sounding services**

🔗 APPLICATION INTEGRATION SERVICES

(Connecting applications using messages or events)

🟢 Amazon EventBridge

Full form: Amazon EventBridge

What it is:
A **serverless event bus** that enables **event-driven architectures**.

What it does:

- Routes events between AWS services, SaaS apps, and custom applications
- Reacts to state changes (for example, EC2 state change → trigger action)

Exam perspective:
Choose **Amazon EventBridge** when the question mentions:

- *Event-driven*
- *React to changes*
- *Decoupled services*
- *Serverless event routing*

❌ **Exam trap:**

- EventBridge is **NOT** a queue
- It does **NOT** store messages like SQS

🟢 Amazon Simple Notification Service (Amazon SNS)

What it is:
A **fully managed publish/subscribe (pub/sub) messaging service**.

What it does:

- Sends messages to **multiple subscribers**
- Supports email, SMS, HTTP, Lambda, and Amazon SQS

Exam perspective:
Choose **Amazon SNS** when the question mentions:

- *Fan-out*
- *Send notifications to many systems*
- *Alerts and notifications*

❌ **Exam trap:**

- SNS does **NOT** hold messages for processing (SQS does)

🟢 Amazon Simple Queue Service (Amazon SQS)

What it is:
A **fully managed message queue** service.

What it does:

- Stores messages until consumers process them
- Decouples producers and consumers
- Supports asynchronous processing

Exam perspective:
Choose **Amazon SQS** when the question mentions:

- *Queue*
- *Buffering*
- *Asynchronous processing*
- *Decoupling applications*

❌ **Exam trap:**

- SQS does **NOT** broadcast messages (SNS does)

💼 BUSINESS APPLICATION SERVICES

🟣 Amazon Connect

Full form: Amazon Connect

What it is:
A **cloud-based contact center service**.

What it does:

- Enables voice and chat customer support
- Scales automatically
- Pay-as-you-go pricing

Exam perspective:
Choose **Amazon Connect** when the scenario mentions:

- *Call center*
- *Customer service*
- *Contact center*

🟣 Amazon Simple Email Service (Amazon SES)

What it is:
A **scalable email sending service**.

What it does:

- Sends transactional and marketing emails
- High deliverability
- Cost-effective

Exam perspective:
Choose **Amazon SES** when the question mentions:

- *Email notifications*
- *Password reset emails*
- *Order confirmations*

❌ **Exam trap:**

- SES ≠ SMS (that's SNS)

🤝 CUSTOMER ENGAGEMENT & SUPPORT SERVICES

🔵 AWS Activate for Startups

What it is:
A program that provides:

- AWS credits
- Training
- Technical support
- Resources for startups

Exam perspective:
Choose this when:

- *Startup*
- *Credits*
- *Early-stage company*

🔵 AWS IQ

What it is:
A service to **hire AWS-certified third-party experts**.

Exam perspective:
Choose **AWS IQ** when:

- *Need expert help*
- *On-demand AWS professional services*

🔵 AWS Managed Services (AMS)

What it is:
A service where **AWS operates and manages cloud infrastructure** on your behalf.

Exam perspective:
Choose **AWS Managed Services (AMS)** when:

- *Enterprise operations*
- *AWS manages day-to-day infrastructure*

🔵 AWS Support

What it is:
AWS technical support plans:

- Basic
- Developer
- Business
- Enterprise

Exam perspective:
Choose **AWS Support** when:

- *Technical assistance*
- *Faster response times*
- *24×7 support*

🛠️ DEVELOPER TOOLS & DEVOPS SERVICES

🟠 AWS AppConfig

Safely manages **application configuration changes**.

🟠 AWS Cloud9

A **cloud-based integrated development environment (IDE)**.

🟠 AWS CloudShell

A **browser-based command-line shell** with AWS CLI preinstalled.

🟠 AWS CodeArtifact

A **managed repository** for storing software packages.

🟠 AWS CodeCommit

A **managed Git-based source control service**.

🟠 AWS CodeBuild

A **fully managed build service** (compile, test code).

🟠 AWS CodeDeploy

Automates **application deployments**.

🟠 AWS CodePipeline

A **CI/CD orchestration service**.

🟠 AWS CodeStar

Provides **project templates** for DevOps workflows.

🟠 AWS X-Ray

Provides **distributed tracing** to analyze application performance and latency.

Exam perspective:
Choose **AWS X-Ray** when:

- *Troubleshoot performance*

- *Find latency in microservices*

🖥️ END-USER COMPUTING SERVICES

🟢 Amazon AppStream 2.0

Streams **desktop applications** to users via a web browser.

Use case:

- No local installation required

🟢 Amazon WorkSpaces

A **fully managed virtual desktop infrastructure (VDI)**.

🟢 Amazon WorkSpaces Web

Provides **secure browser-based access** to internal web apps.

🌐 FRONTEND WEB & MOBILE SERVICES

🟣 AWS Amplify

A **full-stack development service** for web and mobile apps.

Provides:

- Hosting
- Authentication
- APIs
- Backend services

🟣 AWS AppSync

A **managed GraphQL service** for real-time data synchronization.

🌍 INTERNET OF THINGS (IoT) SERVICES

🔴 AWS IoT Core

Connects **IoT devices** securely to AWS.

Exam perspective:

- Device-to-cloud communication

🔴 AWS IoT Greengrass

Extends AWS services to **edge devices**.

Exam perspective:

- Local processing
- Works even with limited internet connectivity

🧠 HIGH-VALUE EXAM SUMMARY

Keyword in Question	AWS Service
Event-driven	Amazon EventBridge
Fan-out notifications	Amazon SNS
Message queue	Amazon SQS
Contact center	Amazon Connect
Email service	Amazon SES
Startup credits	AWS Activate

CI/CD pipeline	AWS CodePipeline
Tracing	AWS X-Ray
Virtual desktop	Amazon WorkSpaces
Web/mobile frontend	AWS Amplify
IoT connectivity	AWS IoT Core

🔥 Exam-Trap MCQs (AWS Service Categories)

Q1

An application must react automatically when an AWS service changes state, without polling or managing servers.
Which AWS service should be used?

A. Amazon Simple Queue Service (Amazon SQS)
B. Amazon Simple Notification Service (Amazon SNS)
C. Amazon EventBridge
D. AWS CodePipeline

Q2

A company wants to send a **single message to multiple subscribers** such as email, SMS, and AWS Lambda simultaneously.
Which service is MOST appropriate?

A. Amazon Simple Queue Service (Amazon SQS)
B. Amazon Simple Notification Service (Amazon SNS)
C. Amazon EventBridge
D. Amazon Simple Email Service (Amazon SES)

Q3

Which AWS service is designed to **store messages until they are processed** by a consumer application?

A. Amazon EventBridge
B. Amazon Simple Notification Service (Amazon SNS)
C. Amazon Simple Queue Service (Amazon SQS)
D. AWS AppConfig

Q4

A company needs a **cloud-based contact center** to handle customer calls and chats with minimal setup.
Which service should be used?

A. Amazon Simple Email Service (Amazon SES)
B. Amazon Connect
C. AWS Support
D. Amazon WorkSpaces

Q5

Which AWS service is specifically designed to **send transactional and marketing emails** at scale?

A. Amazon Simple Notification Service (Amazon SNS)
B. Amazon Simple Email Service (Amazon SES)
C. Amazon Connect
D. AWS Activate for Startups

Q6

A startup is looking for **AWS credits, training, and support** to build its application on AWS.
Which AWS offering should the startup use?

A. AWS IQ
B. AWS Managed Services (AMS)
C. AWS Activate for Startups
D. AWS Support (Enterprise)

Q7

A development team needs a **browser-based shell** with the AWS Command Line Interface (AWS CLI) already configured.
Which service meets this requirement?

A. AWS Cloud9
B. AWS CloudShell
C. AWS CodeCommit
D. AWS CodeBuild

Q8

Which AWS service helps developers **trace and analyze application performance issues** across distributed microservices?

A. AWS CodeDeploy
B. AWS AppConfig
C. AWS X-Ray
D. AWS CodeStar

Q9

Which service provides **fully managed virtual desktops** for end users?

A. Amazon AppStream 2.0
B. Amazon WorkSpaces
C. Amazon WorkSpaces Web
D. AWS Amplify

Q10

A company needs to **securely connect IoT devices** to AWS and send telemetry data to the cloud.
Which service should be used?

A. AWS IoT Greengrass
B. Amazon EventBridge

C. AWS IoT Core
D. Amazon Kinesis

✅ ANSWERS (AT THE END)

Q	Correct Answer	Exam Logic
1	**C**	EventBridge = event-driven, serverless
2	**B**	SNS = fan-out messaging
3	**C**	SQS = message queue
4	**B**	Amazon Connect = contact center
5	**B**	SES = email sending
6	**C**	Activate = startup credits & support
7	**B**	CloudShell = browser-based CLI
8	**C**	X-Ray = distributed tracing
9	**B**	WorkSpaces = virtual desktops
10	**C**	IoT Core = device-to-cloud

🚨 High-Value Exam Traps to Remember

- ❌ SNS ≠ queue (that's SQS)
- ❌ EventBridge ≠ messaging buffer
- ❌ SES ≠ SMS (SNS supports SMS)
- ❌ AppStream 2.0 ≠ virtual desktop (it streams apps)
- ✔ WorkSpaces = VDI
- ✔ IoT Core = cloud connectivity
- ✔ Greengrass = edge processing
