(All AWS services include **full forms**.)

🚀 Domain 3 – Cloud Technology & Services

Task 3.1: Methods of Deploying and Operating in the AWS Cloud (Detailed)

🛠️ PROVISIONING & OPERATING IN AWS (DETAILED)

🖥️ AWS Management Console

What it is:
A **browser-based graphical user interface (GUI)** to manage AWS resources.

How it works:

- You log in via web browser
- Perform actions using menus and forms
- Changes are manual and immediate

Best suited for:

- Learning AWS
- One-time configurations
- Small environments

Limitations:

- Error-prone for large environments
- Not ideal for repeatability
- No version control

📌 **Exam scenario:**
"Admin needs to quickly launch one EC2 instance" → **AWS Management Console**

⌨️ AWS Command Line Interface (CLI)

Full Form: AWS **Command Line Interface**

What it is:
A tool that lets you interact with AWS services using **commands**.

How it works:

- Installed on local machine or EC2

- Uses AWS APIs in the background
- Supports scripting and automation

Benefits:

- Faster than console
- Repeatable commands
- Can be integrated into scripts

Limitations:

- Requires command knowledge
- Still procedural (not declarative)

📌 **Exam scenario:**
"Automate repeated administrative tasks" → **AWS CLI**

💻 AWS Software Development Kits (SDKs)

Full Form: AWS **Software Development Kits**

What it is:
Libraries for programming languages (Python, Java, JavaScript, C#, etc.).

How it works:

- Developers write application code
- SDK makes API calls to AWS services

Best suited for:

- Application-level integration
- Event-driven workflows
- Backend automation

📌 **Exam scenario:**
"Application needs to upload files to Amazon S3 automatically" → **AWS SDK**

🧩 Infrastructure as Code (IaC) – AWS CloudFormation

Full Form: AWS **CloudFormation**

What it is:
A **declarative** way to define infrastructure using templates (YAML/JSON).

How it works:

- You define desired infrastructure state
- AWS provisions and manages resources automatically
- Supports rollback and version control

Key advantages:

- Repeatability
- Consistency
- Reduced human error

📌 **Exam scenario:**
"Deploy same infrastructure across multiple environments" → **AWS CloudFormation**

🔁 ONE-TIME VS REPEATABLE OPERATIONS (DEEPER VIEW)

One-Time Operations

- Manual setup
- No reuse expected
- Quick changes

Tools:

- AWS Management Console

Example:

- Testing a new EC2 instance type

Repeatable Processes

- Multiple environments
- Automation required
- Consistency needed

Tools:

- AWS CloudFormation
- AWS CLI scripts

📌 **Exam phrase:**
"Repeatable, consistent, automated" → **Infrastructure as Code**

☁️ CLOUD DEPLOYMENT MODELS (DETAILED)

☁️ Cloud Deployment

- Entire workload runs in AWS
- Highest elasticity and scalability
- Minimal infrastructure management

Benefits:

- No data center management
- Global reach
- High availability

📌 **Exam scenario:**
"Startup with no existing infrastructure" → **Cloud**

🏢 On-Premises Deployment

- Infrastructure hosted locally
- Uses virtualization
- High upfront cost

Drawbacks:

- Fixed capacity
- High maintenance cost

📌 **Exam scenario:**
"Strict regulatory requirements requiring local hardware" → **On-premises**

🔀 Hybrid Deployment

- Combines AWS + on-premises
- Gradual cloud migration
- Business continuity

Typical use cases:

- Disaster recovery
- Data residency requirements

📌 **Exam scenario:**
"Extend on-premises data center to cloud" → **Hybrid**

🌐 CONNECTIVITY OPTIONS (VERY IMPORTANT)

🌍 Public Internet

How it works:

- Uses standard HTTPS
- No dedicated connection

Performance:

- Variable latency
- Shared bandwidth

Latency:

- Higher and unpredictable
- Depends on internet traffic

Bandwidth:

- Limited by ISP
- Not guaranteed

📌 **Exam scenario:**
"Basic internet access to AWS services" → **Public Internet**

🔐 AWS VPN

Full Form: AWS **Virtual Private Network**

How it works:

- Encrypted tunnel over the public internet
- Uses IPSec

Performance:

- More secure than public internet
- Still internet-dependent

Latency:

- Lower than public internet
- Still variable

Bandwidth:

- Moderate
- Not dedicated

📌 **Exam scenario:**
"Secure connection without dedicated line" → **AWS VPN**

🚀 AWS Direct Connect

Full Form: AWS **Direct Connect**

How it works:

- Dedicated private network connection
- Bypasses public internet

Performance:

- Very low latency
- Consistent performance

Latency:

- Predictable
- Minimal delay

Bandwidth:

- High (1 Gbps to 100 Gbps)
- Dedicated and guaranteed

Cost:

- Higher
- Best for enterprise workloads

📌 **Exam scenario:**
"High bandwidth, low latency, mission-critical workloads" → **AWS Direct Connect**

📊 CONNECTIVITY COMPARISON (EXAM GOLD)

Feature	Public Internet	AWS VPN	AWS Direct Connect
Encryption	❌	✅	✅
Dedicated	❌	❌	✅
Latency	High	Medium	Low
Bandwidth	Low	Medium	High
Cost	Low	Medium	High

🧠 MEMORY RULES FOR EXAM

- **Latency = delay**
- **Bandwidth = data volume per second**
- **Dedicated line → Direct Connect**
- **Encrypted tunnel → VPN**
- **Free & simple → Public Internet**
